DESCENT RATE CHARTS FOR TOP FLIGHT RECOVERY ROUND PARACHUTES

Use these descent rate charts to help choose the size of your parachute. Remember, these are rough estimates since things like atmospheric pressure, altitude, wind speed and temperature (among other things) can affect descent rates.

Top Flight Recovery recommends descent rate targets to fall between 17-22 feet per second (FT/SEC).

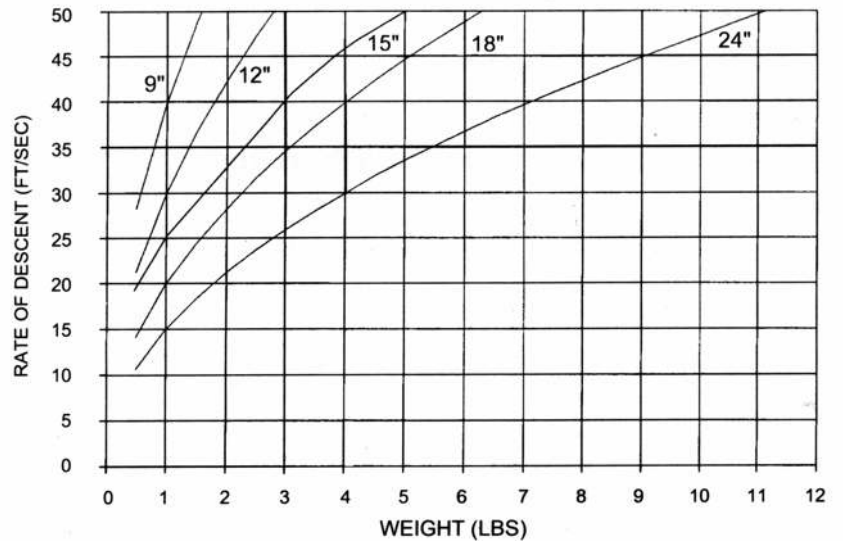

Top Flight Recovery Ripstop Nylon Parachutes are available in regular and thin-mil at Sirius Rocketry.

Click here to go directly to the Top Flight Recovery category at the Sirius Rocketry Webstore.
